HIGHLIGHTS OF PRESCRIBING INFORMATION
These highlights do not include all the information needed to use STRENSIQ safely and effectively. See full prescribing information for STRENSIQ.

STRENSIQ® (asfotase alfa) injection, for subcutaneous use
Initial U.S. Approval: 2015

INDICATIONS AND USAGE
STRENSIQ® is a tissue nonspecific alkaline phosphate indicated for the treatment of patients with perinatal/infantile- and juvenile-onset hypophosphatasia (HPP). (1)

DOSAGE AND ADMINISTRATION
Perinatal/Infantile-Onset HPP (2.1)
• Recommended dosage regimen is 2 mg/kg administered subcutaneously three times per week, or 1 mg/kg administered six times per week. Injection site reactions may limit the tolerability of the six times per week regimen.
• The dose may be increased to 3 mg/kg three times per week for insufficient efficacy.

Juvenile-Onset HPP (2.2)
• Recommended dosage regimen is 2 mg/kg administered subcutaneously three times per week, or 1 mg/kg administered six times per week. Injection site reactions may limit the tolerability of the six times per week regimen.

Preparation and Weight-Based Dosing (2.3):
• Caution: Do not use the 80 mg/0.8 mL vial in pediatric patients weighing less than 40 kg because the systemic asfotase alfa exposure achieved with the 80 mg/0.8 mL vial (higher concentration) is lower than that achieved with the other strength vials (lower concentration). A lower exposure may not be adequate for this subgroup of patients.
• See full prescribing information for tables of weight-based dosing by treatment regimen.

Administration (2.4):
• For subcutaneous injection only.
• Rotate injection sites. Do not administer to areas that are reddened, inflamed or swollen.

CONTRAINDICATIONS
None. (4)

WARNINGS AND PRECAUTIONS
• Hypersensitivity Reactions: Monitor and if a severe reaction occurs, discontinue treatment and initiate appropriate medical treatment. (5.1)
• Lipodystrophy: Localized reactions were reported after several months of treatment; follow proper injection technique and rotate injection sites. (5.2)
• Ectopic Calcifications (eye and kidneys): Monitor using ophthalmologic examinations and renal ultrasounds at baseline and periodically during treatment. (5.3)

ADVERSE REACTIONS
Most common adverse reactions (≥ 10%) are injection site reactions, lipodystrophy, ectopic calcifications and hypersensitivity reactions. (6.1)

DRUG INTERACTIONS
• Drug Interference with Laboratory Tests: Alkaline Phosphatase (ALP) is used as a detection reagent in many laboratory tests and the presence of asfotase alfa in clinical laboratory samples could result in erroneous test results. Inform laboratory personnel and discuss use of an alternative testing platform for patients on treatment. (7.1)
• Serum Alkaline Phosphatase: Serum ALP measurements are expected to be elevated during treatment and may be unreliable for clinical decision making. (7.1)

To report SUSPECTED ADVERSE REACTIONS, contact Alexion Pharmaceuticals, Inc. at 1-844-239-6783 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.
See 17 for PATIENT COUNSELING INFORMATION and FDA-approved patient labeling.

FULL PRESCRIBING INFORMATION
1 INDICATIONS AND USAGE
STRENSIQ® is indicated for the treatment of patients with perinatal/infantile- and juvenile-onset hypophosphatasia (HPP).

2 DOSAGE AND ADMINISTRATION
2.1 Dosage for Perinatal/Infantile-Onset HPP
The recommended dosage regimen of STRENSIQ for the treatment of perinatal/infantile-onset HPP is 6 mg/kg per week administered subcutaneously as either:
• 2 mg/kg three times per week, or
• 1 mg/kg six times per week. Injection site reactions may limit the tolerability of the six times per week regimen (see Adverse Reactions (6.1)).
The dose of STRENSIQ may be increased for lack of efficacy (e.g., no improvement in respiratory status, growth, or radiographic findings) up to 9 mg/kg per week administered subcutaneously as 3 mg/kg three times per week.

2.2 Dosage for Juvenile-Onset HPP
The recommended dosage regimen of STRENSIQ for the treatment of juvenile-onset HPP is 6 mg/kg per week administered subcutaneously as either:
• 2 mg/kg three times per week, or
• 1 mg/kg six times per week. Injection site reactions may limit the tolerability of the six times per week regimen (see Adverse Reactions (6.1)).

2.3 Preparation and Weight-Based Dosing Tables
Caution: Do not use the 80 mg/0.8 mL vial of STRENSIQ in pediatric patients weighing less than 40 kg because the systemic exposure of asfotase alfa achieved with the 80 mg/0.8 mL vial (higher concentration) is lower than that achieved with the other strength vials (lower concentration). A lower exposure may not be adequate for this subgroup of patients (see Dosage Forms and Strengths (3), Clinical Pharmacology (12.3)).

1. Determine the volume needed for the prescribed dosage based on the patient’s weight and recommended dosage. Follow these steps to determine the patient dose.

Total dose (mg) = patient’s weight (kg) × prescribed dose (mg/kg)

Total injection volume (mL) = Total dose (mg) divided by concentration (40 mg/mL or 80 mg/0.8 mL)

Round total injection volume to the nearest hundredth of a mL

Total number of vials = Total injection volume divided by vial volume (mL)

2. Determine frequency of weekly injections.

3. Determine dose. Patient weights should be rounded to the nearest kilogram when determining dose. Use the following tables for guidance, for patients administering 2 mg/kg three times per week (Table 1), 1 mg/kg six times per week (Table 2) and for dose escalations to 3 mg/kg three times per week, recommended only for patients with perinatal/infantile-onset HPP (see Dosage and Administration (2.1) (Table 3).

4. When preparing a volume for injection greater than 1 mL, split the volume equally between two syringes, and administer two injections. When administering the two injections, use two separate injection sites.

* Do not use the 80 mg/0.8 mL vial of STRENSIQ in pediatric patients weighing less than 40 kg (see Clinical Pharmacology (12.3)).
** When preparing a volume for injection greater than 1 mL, split the volume equally between two syringes, and administer two injections. When administering the two injections, use two separate injection sites.
CONTRAINDICATIONS

3. Do NOT administer injections in areas that are reddened, inflamed, or swollen.

5. Lipodystrophy

Localized lipodystrophy, including lipoatrophy and lipo hypertrophy, has been reported at injection sites after several months in patients treated with STRENSIQ in clinical trials [see Adverse Reactions (6.1)]. Advise patients to follow proper injection technique and to rotate injection sites [see Dosage and Administration (2.4)].

5.3 Ectopic Calcifications

Patients with HPP are at increased risk for developing ectopic calcifications. In clinical trials with STRENSIQ, 14 cases (14%) of ectopic calcification of the eye including the cornea and conjunctiva, and the kidneys (nephrocalcinosis) were reported. There was insufficient information to determine whether or not the reported events were consistent with the disease or due to STRENSIQ. No visual changes or changes in renal function were reported resulting from the occurrence of ectopic calcifications.

Ophthalmological examinations and renal ultrasounds are recommended at baseline and periodically during treatment with STRENSIQ to monitor for signs and symptoms of ophthalmic and renal ectopic calcifications and for changes in vision or renal function.

6. ADVERSE REACTIONS

The following adverse reactions are described below and elsewhere in the labeling:

- Hypersensitivity Reactions [see Warnings and Precautions (5.1)]
  - Lipodystrophy [see Warnings and Precautions (5.2)]
  - Ectopic Calcifications [see Warnings and Precautions (5.3)]

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

The data described below reflect exposure to STRENSIQ in 99 patients with perinatal/infantile- or juvenile-onset HPP (age 1 day to 58 years) treated with STRENSIQ, most for more than 2 years (range 1 day to 312 weeks [78 months]): 51 patients received at least 96 weeks (24 months) of treatment and 39 patients received 168 weeks (42 months) or more of treatment.

Common Adverse Reactions

Overall, the most common adverse reactions reported were injection site reactions (63%). Other common adverse reactions included lipodystrophy (28%), ectopic calcifications (14%), and hypersensitivity reactions (12%).

Table 4 summarizes the adverse reactions that occurred at a rate of at least 10% in clinical trials following subcutaneous injection of STRENSIQ, by patient population and STRENSIQ dosage regimen.

The frequency of injection site reactions, lipodystrophy and ectopic calcification were higher in patients with juvenile-onset HPP as compared to perinatal/infantile-onset HPP patients.

The majority of injection site reactions resolved within a week. Two patients experienced injection site reactions that led to reductions of their STRENSIQ dose. One patient switched from six times per week dosing to three times per week dosing as a result of injection site reactions. One other patient experienced a severe injection site reaction of injection site discoloration and withdrew from the trial.

2.4 Administration

STRENSIQ is for subcutaneous injection only.

1. Administer STRENSIQ within 1 hour upon removal of the vial(s) from refrigeration.

2. Rotate the injection from among the following sites to reduce the risk of lipodystrophy: abdominal area, thigh, or defolled (see Warnings and Precautions (5.2), Adverse Reactions (6.1));

3. Do NOT administer injections in areas that are reddened, inflamed, or swollen.

4. Inject STRENSIQ subcutaneously into the determined site and properly dispose of the needle.

5. STRENSIQ vials are single use only. Discard any unused product.

3 DOSAGE FORMS AND STRENGTHS

STRENSIQ is supplied as a sterile, preservative-free, nonpyrogenic, clear, slightly opalescent or opalescent, colorless to slightly yellow aqueous solution; few small translucent or white particles may be present. The product is available as:

- Injection: 18 mg/0.45 mL, 28 mg/0.7 mL, 40 mg/mL, or 80 mg/0.8 mL solution in single-use vials

4 CONTRAINdications

None.
4. Inject STRENSIQ subcutaneously into the determined site and properly dispose of the needle.

2. Rotate the injection from among the following sites to reduce the risk of lipodystrophy:
   - abdomen
   - thigh
   - buttocks

2. For patients weighing less than 40 kg, use one syringe and administer one injection. When administering the one injection, use one 80 mg/0.8 mL vial.

2. Do not use the 80 mg/0.8 mL vial of STRENSIQ in pediatric patients weighing less than 40 kg.

</tbody>
</table>

*Adverse reactions are from the combined period of 6 mg/kg and above (i.e. total drug exposure regardless of starting dose and intermediary doses as long as the patient reached doses > 6 mg/kg).

### 6.1 Clinical Trials Experience

The frequency of injection site reactions, lipodystrophy and ectopic calcification were higher in studies of adult-onset HPP. In studies of infant-onset HPP:

### 6.2 Immunogenicity

As with all therapeutic proteins, there is potential for immunogenicity. During clinical trials, anti-drug antibodies have been detected in patients receiving treatment with STRENSIQ using an electrochemiluminescent (ECL) immunoassay. Antibody positive samples were tested to determine the presence of neutralizing antibodies based on in vitro inhibition of the catalytic activity of STRENSIQ. Among 98 patients with hypophosphatasia (HPP) enrolled in the clinical trials and who had post-baseline anti-drug antibody data, 76% (78/78) tested positive for anti-drug antibodies at some time point after receiving STRENSIQ treatment. Among those 76 patients, 34% (45/76) also showed the presence of neutralizing antibodies. No correlation was observed between the anti-drug antibody titer and neutralizing antibody (% inhibition) values. Formation of anti-drug antibody resulted in a reduced systemic exposure of asfotase alfa. (See Clinical Pharmacology (12.3)).

### 7DRUG INTERACTIONS

#### 7.1 Drug Interference with Laboratory Tests

**Laboratory Tests Utilizing Alkaline Phosphatase as a Detection Reagent**

Studies have shown that there is analytical interference between asfotase alfa and laboratory tests that utilize an alkaline phosphatase (ALP)-conjugated test system, rendering erroneous test results in patients treated with STRENSIQ. ALP-conjugated test systems are utilized to measure substances such as hormones, bacterial antigens and antibodies. Therefore, it is recommended that laboratory assays which do not have ALP-conjugate technology be used when testing samples from patients who are receiving STRENSIQ.

To avoid erroneous test results for patients treated with STRENSIQ, inform laboratory personnel that the patient is being treated with STRENSIQ and discuss the use of a testing platform which does not utilize an ALP-conjugated test system.

**Serum Alkaline Phosphatase**

High serum ALP measurements detected through clinical laboratory testing are expected in patients receiving STRENSIQ and reflect circulating concentrations of asfotase alfa. Do not rely on serum ALP measurements for clinical decision making in patients treated with STRENSIQ.

### 8 USE IN SPECIFIC POPULATIONS

#### 8.1 Pregnancy

**Risk Summary**

There are no available human data on STRENSIQ use in pregnant women to inform a drug product information statement. To the best of our knowledge, no embryotoxicity, teratogenicity or adverse effects on pregnancy or infant have been reported in animal studies. Asfotase alfa administered intravenously to pregnant rabbits and rats during the period of organogenesis showed no evidence of fetotoxicity, embryolethality or teratogenicity at doses causing plasma exposures up to 21 and 24 mg/kg, respectively, the exposure at the recommended human dose (see Data).

In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2 to 4% and 15 to 20%, respectively.

#### Data

**Animal Data**

Asfotase alfa administered during the period of organogenesis to rats (from gestation Day 6 to Day 19 post-partum) and rabbits (on gestation days 7 to 19) at intravenous doses up to 50 mg/kg/day, approximately 21 and 24 times the human AUC of 65486 ng/h/mL at 2 mg/kg dose administered three weeks for a 50 kg individual, respectively did not cause any adverse effects on embryofetal development. A pre- and post-natal development study in pregnant rats showed no evidence of adverse effects on pre- and post-natal development at intravenous doses (from Day 6 of gestation to Day 19 postpartum) of asfotase alfa up to 50 mg/kg/day approximately 21 times the human AUC of 65486 ng/mL at 2 mg/kg dose administered three times weekly for a 50 kg individual.

### 8.2 Lactation

**Risk Summary**

There are no data on the presence of asfotase alfa in human milk, the effects on the breastfed infant, or the effects on milk production. The developmental and health benefits of breastfeeding should be considered along with the mother’s need for STRENSIQ and any potential adverse effects on the breastfed infant from asfotase alfa or from the underlying maternal condition.

### 8.4 Pediatric Use

No patients with infantile-onset or juvenile-onset HPP aged 65 years were enrolled in clinical trials of STRENSIQ. Therefore, there is no information available to determine whether patients aged 65 years and over respond differently from younger patients.

### 11 DESCRIPTION

STRENSIQ is a formulation of asfotase alfa, which is a soluble glycoprotein composed of two identical polypeptide chains. Each chain contains 726 amino acids with a theoretical mass of 161 kDa. Each chain consists of the catalytic domain of human tissue non-specific alkaline phosphatase (TNSALP), the human immunoglobulin G, Fc domain and a deca-aspartate peptide used as a bone targeting domain. The two polypeptide chains are covalently linked by two disulfide bonds.

STRENSIQ is a tissue nonspecific alkaline phosphatase produced by recombinant DNA technology in a Chinese hamster ovary cell line. TNSALP is a metallo-enzyme that catalyzes the hydrolysis of phosphomonoesters with release of inorganic phosphate and alcohol. Asfotase alfa has a specific activity of 620 to 1250 units/mg. One activity unit is defined as the amount of asfotase alfa required to form 1 μmol of p-nitrophenol from pNPP per minute at 37°C.

STRENSIQ (asfotase alfa) is a sterile, preserve-free, nonpyrogenic, clear, slightly opalescent or pale yellow, colorless to slightly yellow, with few small translucent or white particles, aqueous solution for subcutaneous administration. STRENSIQ is supplied in glass single-use vials containing asfotase alfa; dibasic sodium phosphate, heptahydrate; monobasic sodium phosphate, monohydrate; and sodium chloride at a pH between 7.2 and 7.6. Table 5 describes the content of STRENSIQ vial presentations.

### 12 CLINICAL PHARMACOLOGY

#### 12.1 Mechanism of Action

HPP is caused by a deficiency in TNSALP enzyme activity, which leads to elevations in several TNSALP substrates, including inorganic pyrophosphate (Pi). Elevated extracellular levels of Pi block hydroxyapatite crystal growth which inhibits bone mineralization and causes an accumulation of unmineralized bone matrix which manifests as rickets and bone deformation in infants and children and as osteomalacia (softening of bones) once growth plates close, along with muscle weakness. Replacement of the TNSALP enzyme upon STRENSIQ treatment reduces the enzyme substrate levels.

#### 12.2 Pharmacodynamics

Perinatal/infantile- and juvenile-onset HPP patients treated with STRENSIQ had reductions in plasma TNSALP substrates, FPI and pyridoxal 5’-phosphate (PLP) within 6 to 12 weeks of treatment. Reductions in plasma Pi and PLP levels did not correlate with clinical outcomes. Bone biopsy data from perinatal/infantile-onset and juvenile-onset HPP patients treated with STRENSIQ demonstrated decreases in osteoid volume and thickness indicating improved bone mineralization.

#### 12.3 Pharmacokinetics

Based on data in 38 HPP patients, the pharmacokinetics of asfotase alfa exhibit dose proportionality across the dose range of 0.3 mg/kg to 3 mg/kg and appear to be time-independent. Steady state exposure was achieved as early as three weeks after the administration of the first dose. The elimination half-life following subcutaneous administration was approximately 5 days. Table 6 summarizes the pharmacokinetic parameters following multiple doses in 20 HPP patients after subcutaneous administration of STRENSIQ at 2 mg/kg three times per week in Study 2 (age of less than or equal to 5 years) and Study 3 (age of greater than 5 to 12 years), indicating the pharmacokinetics were similar between patients in the two age groups.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term studies in animals to evaluate carcinogenic potential or studies to evaluate mutagenic potential have not been performed with asfotase alfa. Asfotase alfa at intravenous doses up to 50 mg/kg/day administered daily in pregnant rats (approximately 21 times the human AUC of 65,486 ng.h/mL at 2 mg/kg dose administered three times weekly for a 50 kg individual) was found to have no adverse effect on fertility and reproductive performance of male and female rats.

14 CLINICAL STUDIES

14.1 Perinatal/Infantile-Onset HPP

Study 1 was a 24-week prospective single-arm trial in 11 patients, 7/11 (64%) were female and 10/11 (91%) were white, aged 3 weeks to 39.5 months with severe perinatal/infantile-onset HPP. Severe perinatal/infantile-onset HPP was defined as biochemical, medical history and radiographic evidence of HPP as well as the presence of any of the following: rachitic chest deformity, vitamin B6-dependent seizures, or failure to thrive. Ten of 11 patients completed the 24-week trial and continued treatment in the extension phase. Nine patients have been treated for at least 216 weeks (54 months) and 4 patients have been treated for over 240 weeks (60 months). Patients received STRENSIQ at 3 mg/kg per week for the first month; subsequently, dose increases up to 9 mg/kg per week were allowed for changes in weight and/or for lack of efficacy. All 10 patients required dose increases of up to 6 mg/kg per week or higher; 9 patients continued on the same dose by the end of the study. One patient increased his dose from 9 mg/kg per week to 6 mg/kg per week based on PK data. Study 2 was a prospective open-label study in 59 patients, 32/59 (54%) were female and 46/59 (78%) were white, aged 1 day to 78 months with perinatal/infantile-onset HPP. Patients received STRENSIQ at 6 mg/kg per week for the first 4 weeks. Ten patients received dose increases higher than 6 mg/kg per week due to suboptimal clinical response, with dose increases occurring between 8 and 24 weeks after starting treatment. The recommended dosage regimen of STRENSIQ for the treatment of perinatal/infantile-onset HPP is up to 9 mg/kg per week administered subcutaneously as 3 mg/kg three times per week.[see Dosage and Administration (2.1)]. Forty-one patients have been treated for at least 24 weeks (6 months) and 15 patients have been treated for at least 96 weeks (24 months).

Survival and Ventilation-Free Survival

Survival and invasive ventilation-free survival were compared in STRENSIQ-treated patients (Studies 1 and 2) with a historical cohort of untreated patients with similar clinical characteristics (Table 7 and Figure 1).

Table 7: Survival and Invasive Ventilation-Free Survival in STRENSIQ-Treated versus Historical Control Patients with Perinatal/Infantile-Onset HPP

<table>
<thead>
<tr>
<th>Survival</th>
<th>STRENSIQ-Treated n = 68</th>

</tr>
</tbody>
</table>

* Adjusted for year of diagnosis.
** Alive and not initiating invasive ventilation after start of STRENSIQ treatment. STRENSIQ-treated patients on invasive ventilation at baseline were excluded from this analysis. In patients who required any form of respiratory support, 21 of 26 (81%) of the treated patients survived through their last assessment (median age at last assessment was 3.2 years of age), versus 1 of 20 (5%) of historical controls.
Eight of 20 (40%) patients with juvenile-onset HPP experienced new fractures during the course of treatment. There were insufficient data to assess the effect of STRENSIQ on fractures.

Gait/Mobility
Gait was assessed using a modified Performance Oriented Mobility Assessment-Gait (MPOMA-G) scale in 8 STRENSIQ-treated patients at 6 month intervals out to 36 months. Mobility was also assessed using the 6 Minute Walk Test (6MWT) in 7 of the 8 patients. Step length improved by at least 1 point in either foot in 6/8 patients compared to 1/6 (17%) control patients. The proportion of patients who had 6MWT percent predicted values within the normal range for age, sex, and height-matched peers increased from 0/8 patients at baseline to 6/6 patients (100%) by Month 48 and all 6 were also able to walk longer distances at this time point compared to baseline.

16 HOW SUPPLIED/STORAGE AND HANDLING

STRENSIQ is supplied as a sterile, nonpyrogenic, preservative free, clear, slightly opalescent or opalescent, colorless to slightly yellow aqueous solution; a few small translucent or white particles may be present. The product is available as single-use vials in a carton of one (1) or twelve (12) vials at the following strengths:

<table>
<thead>
<tr>
<th>Strength</th>

</tr>
</tbody>
</table>

STRENSIQ vials must be stored in the original carton until the time of use under refrigerated conditions at 2°C to 8°C (36°F to 46°F) and protected from light. Once removed from refrigeration, STRENSIQ should be administered within 1 hour. Do not use beyond the expiration date stamped on the carton. DO NOT FREEZE OR SHAKE. Vials are single-use only. Discard any unused product.

17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Patient Labeling and Instructions for Use).

Advise patients or caregivers of the following:

Preparation

- When preparing a volume for injection greater than 1 mL, split the volume equally between two syringes, and administer two injections. When administering the two injections, use two separate injection sites.
- Inspect the solution in the vial(s) for particulate matter and discoloration.
- Assemble injection supplies. Administer STRENSIQ using sterile disposable syringes and injection needles. The syringes should be of small enough volume that the prescribed dose can be withdrawn from the vial with reasonable accuracy. Always use a new syringe and needle.
- Remove vial cap, aseptically prepare the vial and insert the syringe into the vial to withdraw the prescribed dose for administration.
- Remove any air bubbles in the syringe and verify the correct dose.

Administration

- Administer STRENSIQ within 1 hour upon removal of the vial(s) from refrigeration.
- Rotate the injection site to reduce the risk of lipohypertrophy and injection site atrophy.
- Do NOT administer injections in areas that are reddened, inflamed, or swollen.
- Inject STRENSIQ subcutaneously into the determined site and properly dispose of the needle.
- STRENSIQ vials are single use only. Discard any unused product.

Hypersensitivity Reactions

- Reactions related to administration and injection may occur during and after STRENSIQ treatment. Inform patients of the signs and symptoms of hypersensitivity reactions, and have them seek immediate medical care should signs and symptoms occur.

Lipodystrophy

- Lipohypertrophy (enlargement or thickening of tissue) and localized atrophy (depression in the skin) have been reported at injection sites after several months. Follow proper injection technique and rotate injection sites.

Hypophosphatasia (HPP) Registry

- A registry has been established in order to better understand HPP in the population, and to monitor and evaluate long-term treatment effects of STRENSIQ. Patients and their caregivers should be encouraged to participate and advised that their participation is voluntary and may involve long-term follow-up. For more information, visit www.hppregistry.com

**Patient Information**

**STRENSIQ® (stren' sik)**

(asfotase alfa) injection, for subcutaneous use

**What is STRENSIQ?**

STRENSIQ is a prescription medicine used to treat people with perinatal, infantile, and juvenile onset hypophosphatasia (HPP).

**Before using STRENSIQ, tell your healthcare provider about all of your medical conditions, including if you:**

- are allergic to asfotase alfa or any of the ingredients in STRENSIQ. See the end of this leaflet for a complete list of ingredients in STRENSIQ.
- are pregnant or planning to become pregnant. It is not known if STRENSIQ will harm your unborn baby.
- are breastfeeding or plan to breastfeed. It is not known if STRENSIQ passes into your breast milk. Talk to your healthcare provider about the best way to feed your baby if you use STRENSIQ.

**Tell your healthcare provider about all the medications you take,** including prescription and over-the-counter medicines, vitamins, and herbal supplements.

There is a registry for people who use STRENSIQ. The purpose of this registry is to collect information about HPP and about what happens when you use STRENSIQ for a long time. For more information about this registry, talk with your healthcare provider or go to www.hppregistry.com.

**How should I use STRENSIQ?**

- See the “Instructions for Use” that come with STRENSIQ for detailed instructions about the right way to use STRENSIQ.
- Use STRENSIQ exactly as your healthcare provider tells you to.
- Your healthcare provider will tell you how much STRENSIQ to use and when to use it.
- Your healthcare provider may change your dose if needed.
- Change (rotate) your injection site with each injection. **Do not** use the same injection site for each injection.

**What are the possible side effects of STRENSIQ?**

STRENSIQ may cause serious side effects, including:

- **serious allergic (hypersensitivity) reactions.** Serious allergic reactions have happened in some people who use STRENSIQ. Stop using STRENSIQ and go to the nearest hospital emergency room right away if you have any of the signs and symptoms of a serious allergic reaction including:
  - difficulty breathing
  - swelling of your eyes, lips or tongue
  - hives
  - feeling faint
  - nausea or vomiting
  - dizziness
  - itching of lips, tongue or throat
  - choking sensation
  - skin thickening or pits at the injection site (lipodystrophy). Lipodystrophy at the injection site has happened several months after using STRENSIQ.
  - **calcium build up in your eyes and kidneys.** You healthcare provider should check your eyes and kidneys while you use STRENSIQ.

The most common side effects of STRENSIQ include local skin injection site reactions (including skin red patches, bruising, color change, pain, itching, thinning, swelling, pits, and bumps) and calcium build up in your eyes and kidneys.

These are not all the possible side effects of STRENSIQ. For more information, ask your healthcare provider or pharmacist. Call your healthcare provider for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

**General information about the safe and effective use of STRENSIQ**

Medicines are sometimes prescribed for purposes other than those listed in a Patient Information leaflet. Do not use STRENSIQ for a condition for which it was not prescribed. Do not give STRENSIQ to other people, even if they have the same symptoms that you have. It may harm them. You can ask your pharmacist or healthcare provider for information about STRENSIQ that is written for healthcare professionals.

**What are the ingredients in STRENSIQ?**

- **Active ingredient:** asfotase alfa
- **Inactive ingredients:** dibasic sodium phosphate, heptahydrate; monobasic sodium phosphate, monohydrate and sodium chloride.

Manufactured by: Alexion Pharmaceuticals, Inc., New Haven, CT 06510 USA U.S. License Number: 1743

This Patient Information has been approved by the U.S. Food and Drug Administration Approved: 10/2016
Instructions for Use
STRENSIQ® (stren’ sik)
(asfotase alfa)
injection, for subcutaneous use
vial

Read this Instructions for Use before you start using STRENSIQ and each time you get
a refill. There may be new information. This information does not take the place of
talking to your healthcare provider about your medical condition or your treatment.

Do not share your syringes or needles with anyone else. You may give an infection
to them or get an infection from them.

Supplies needed to give your STRENSIQ injection (See Figure A):
• 1 or 2 STRENSIQ vial(s)
• 1 or 2 sterile disposable 1 mL syringes for injection with 25 to 29 Gauge (G),
  ½ inch needles.
• 2 alcohol wipes
• 1 gauze or cotton ball
• a clean flat surface like a table
• 1 sharps container for throwing away used needles and syringes. See “Disposing
  of used needles and syringes” at the end of these instructions.

Preparing your STRENSIQ dose:
• Prepare a clean flat surface, like a table or counter top
• Gather all the supplies you will need to give your STRENSIQ injection
• Wash your hands with soap and water

Step 1: Check the liquid in the
STRENSIQ vial. STRENSIQ
liquid should look clear or
slightly yellow and may
have a few small white
particles in it. Do not use it
if the liquid is discolored or
contains any lumps or large
particles in it. Throw it away
and get a new vial.

Step 2: Using your thumb, flip
the plastic cap off the
STRENSIQ vial.

Step 3: Remove the needle from
the package. Pick up the
syringe and place the
needle on the tip of the
syringe. Push down and
twist the needle onto the
syringe until it is tight.

Step 4: Hold the syringe with the
needle pointing up and
pull back the plunger until
the top of the plunger
reaches the line for your
prescribed dose.

Step 5: Pull the cap straight off of
the needle.
  • Do not touch the
    needle or let the
    needle touch any
    surface.

Step 6: Hold the STRENSIQ vial
firmly on a flat surface, then
push the needle through
the rubber stopper of the
STRENSIQ vial.

Step 7: Keeping the needle in the
STRENSIQ vial, lift the vial
and turn it upside down with
the needle pointing toward
the ceiling. Slowly push the
plunger all the way in.

Step 8: With the needle tip still in
the liquid, slowly pull back
the plunger until the top of
the plunger reaches the
line slightly past the line for
your prescribed dose. Do
not pull the needle out of
the STRENSIQ vial. Slowly
push the plunger up until
the top of the plunger
reaches the line for your
prescribed dose.
  • Check the syringe to
    make sure that you
    have the right dose.

Step 9: Turn the STRENSIQ vial
upright and pull the
syringe straight out of the
vial’s rubber stopper.
  • Do not touch the
    needle or allow the
    needle to touch any
    surface.
**Patient Information**

Approved: 10/2016

This Patient Information has been approved by the U.S. Food and Drug Administration.

**STRENSIQ**

STRENSIQ is a prescription medicine used to treat people with perinatal, infantile, or juvenile-onset hypophosphatasia (HPP). STRENSIQ is only available through a specialty pharmacy.

**What is STRENSIQ?**

STRENSIQ is a medicine for people who have perinatal, infantile, or juvenile-onset HPP. STRENSIQ is made from a medicine called asfotase alfa. It is a protein that helps your body break down and use phosphorus in your bones and other tissues. STRENSIQ helps your body use phosphorus in your bones and other tissues. This can help keep your bones and other tissues healthy.

**Who should not use STRENSIQ?**

Do not use STRENSIQ:

- If you are allergic to asfotase alfa or any of the ingredients in STRENSIQ. See the end of this Patient Information for a complete list of ingredients.
- If you are pregnant or plan to become pregnant. It is not known if STRENSIQ will harm your unborn baby. You should not use STRENSIQ during pregnancy unless the benefits outweigh the risks to the fetus.
- If you are breastfeeding. It is not known if STRENSIQ enters your breast milk. Talk to your healthcare provider about the best way to feed your baby while using STRENSIQ.

**How should I use STRENSIQ?**

STRENSIQ is given in daily injections under the skin (subcutaneously) of your stomach-area (abdomen), upper arms, or upper legs. Your healthcare provider will tell you the dose and schedule for your injections.

**Instructing your STRENSIQ dose:**

- **Step 1:** Choose your injection site. STRENSIQ is injected under the skin (subcutaneously) of your stomach-area (abdomen), upper arms, or upper legs.
  - **Change (rotate) your injection site with each injection.** Do not use the same injection site for each injection.
  - **Do not** inject STRENSIQ into skin that is red, hot, or swollen.
  - **Wipe** your skin with an alcohol wipe. Let the site dry before you inject your dose.

- **Step 2:** Pinch the skin. Hold the syringe at a 90° angle (straight up and down) and insert the needle into your skin. For patients with little fat, hold the syringe at a 45° angle and insert the needle into your skin.

- **Step 3:** Push the plunger all the way in to give your dose.

- **Step 4:** Wash your hands with soap and water.

- **Step 5:** Using your thumb, flip the needle on the tip of the STRENSIQ vial.

- **Step 6:** With your finger, pull back the plunger until you reach the line for your dose.

- **Step 7:** Slowly inject STRENSIQ into skin the site dry before you inject your dose.

- **Step 8:** Do not shake your STRENSIQ vials.

- **Step 9:** Do not recap the needle. Recapping the needle can lead to a needle stick injury.

- **Step 10:** Hold the syringe with the needle pointing up and tap the barrel of the syringe with your finger to remove any air bubbles.

- **Step 11:** Pull the needle out of your skin.
  - If you see blood after you take the needle out of your skin, press your injection site with a piece of gauze or alcohol wipe.
  - Do not recap the needle. Recapping the needle can lead to a needle stick injury.

If you need a second injection for your prescribed dose, get another STRENSIQ vial and repeat steps 1 through 14.

**Disposing of used needles and syringes:**

- Put your used needles in a FDA-cleared sharps disposal container right away after use. Do not throw away (dispose of) loose needles and syringes in your household trash.
- If you do not have a FDA-cleared sharps disposal container, you may use a household container that is:
  - made of a heavy-duty plastic,
  - can be closed with a tight-fitting, puncture-resistant lid, without sharps being able to come out,
  - upright and stable during use,
  - leak-resistant, and
  - properly labeled to warn of hazardous waste inside the container.
- When your sharps disposal container is almost full, you will need to follow your community guidelines for the right way to dispose of your sharps disposal container. There may be state or local laws about how you should throw away used needles and syringes. For more information about safe sharps disposal, and for specific information about sharps disposal in the state that you live in, go to the FDA’s website at: http://www.fda.gov/safesharpdisposal.
- Do not dispose of your used sharps disposal container in your household trash unless your community guidelines permit this. Do not recycle your used sharps disposal container.

**How should I store STRENSIQ?**

- Store STRENSIQ in the original carton in the refrigerator between 36°F to 46°F (2°C to 8°C) until you are ready to use it.
- Do not freeze your STRENSIQ vials. Do not use STRENSIQ if it has been frozen.
- Do not shake your STRENSIQ vials.
- Protect STRENSIQ from light until you are ready to use it.
- Do not use STRENSIQ after the expiration date printed on the carton.
- STRENSIQ vials are for 1 time use only. Throw away any unused STRENSIQ left in the vial.

**Keep STRENSIQ and all medicines, needles and syringes out of the reach of children.**
